## **1 Introduction**

There are several papers in which some numbers were proven to be solitary, such as 18. There are also papers in which possibilities for friends of 10 are narrowed down.

## **2 Theoretical Analysis: Neural Networks**

### **2.1 Artificial Neural Networks and their Architectures**

### **2.2 The Neuron**

### **2.3 Network Architectures**

#### **2.3.1 Feed-Forward Networks**

#### **2.3.2 Recurrent Networks**

### **2.4 Learning**

## **3 Computational Approaches**

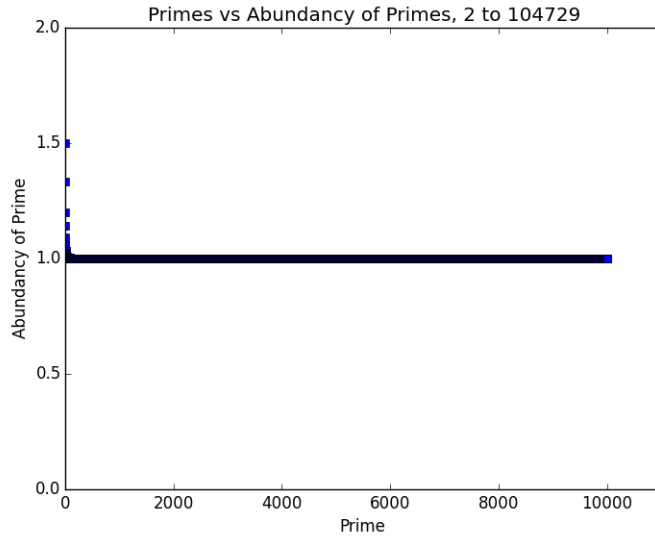

### **3.1 Implementation Detail and Process**

All calculations were performed in Python 2.7, utilizing Matplotlib for graph renderings, excepting curve-fitting, which was performed in Microsoft Excel due to the limited scope of this investigation. Computations were performed on a Linux-based server hosted by Texas A& M University.

Random samples of the first 1000, 10,000, and 100,000 primes were taken to generate curves, with  $r^2$  values recorded for each. A logarithmic curve was used to fit each data set.

## 4 Results

The abundancy function, when given prime inputs, has results as below:

correlation between  $sig(n)$  and  $n$ .

A random sample was taken from the aforementioned subsets of the first million primes using a random number generator from the Random library in Python. Logarithmic regression equations were performed, with the results as below:

## 5 Discussion

It is clear that the abundancy function cannot be fitted with a logarithmic curve. No numbers were correctly matched by any of the equations determined for each sample. It is not possible that the accuracy of each equation could be improved with a larger sample size of primes: none of the curves obtained will asymptotically approach 1. Future research should consider a better fit to the abundancy function and perhaps first analyze the rate at which it converges to 1.

## 6 Individual Contributions

### 6.1 Stephen Capps

### 6.2 Sarah Sahibzada

Performed computational investigations on the densities of the abundancy function, distribution of friendly numbers, and the convergence of the abundancy function for the prime numbers.

### 6.3 Taylor Wilson
